Biosolids GHGs
formulas to mitigate climate change

What We Will Cover Today

- History of the Biosolids Emissions Assessment Model (BEAM)
- BEAM Basics
- Current version and planned updates
- How BEAM can be used
 - Examples from water resource recovery facilities (WRRFs)
- BEAM findings, lessons learned, future uses

GHG Emission Sources from Wastewater Treatment Processes

Disclaimer: Wastewater treatment greenhouse gas emissions are highly variable and process-specific. This figure is generalized and does not account for variables that could introduce or eliminate emissions from certain processes

Biosolids Emissions Assessment Model (BEAM)

What is it?

- Excel spreadsheet
- Just for solids, not whole WRRF
- Scopes 1, 2, 3, and biogenic emissions
- Emissions factors from published literature

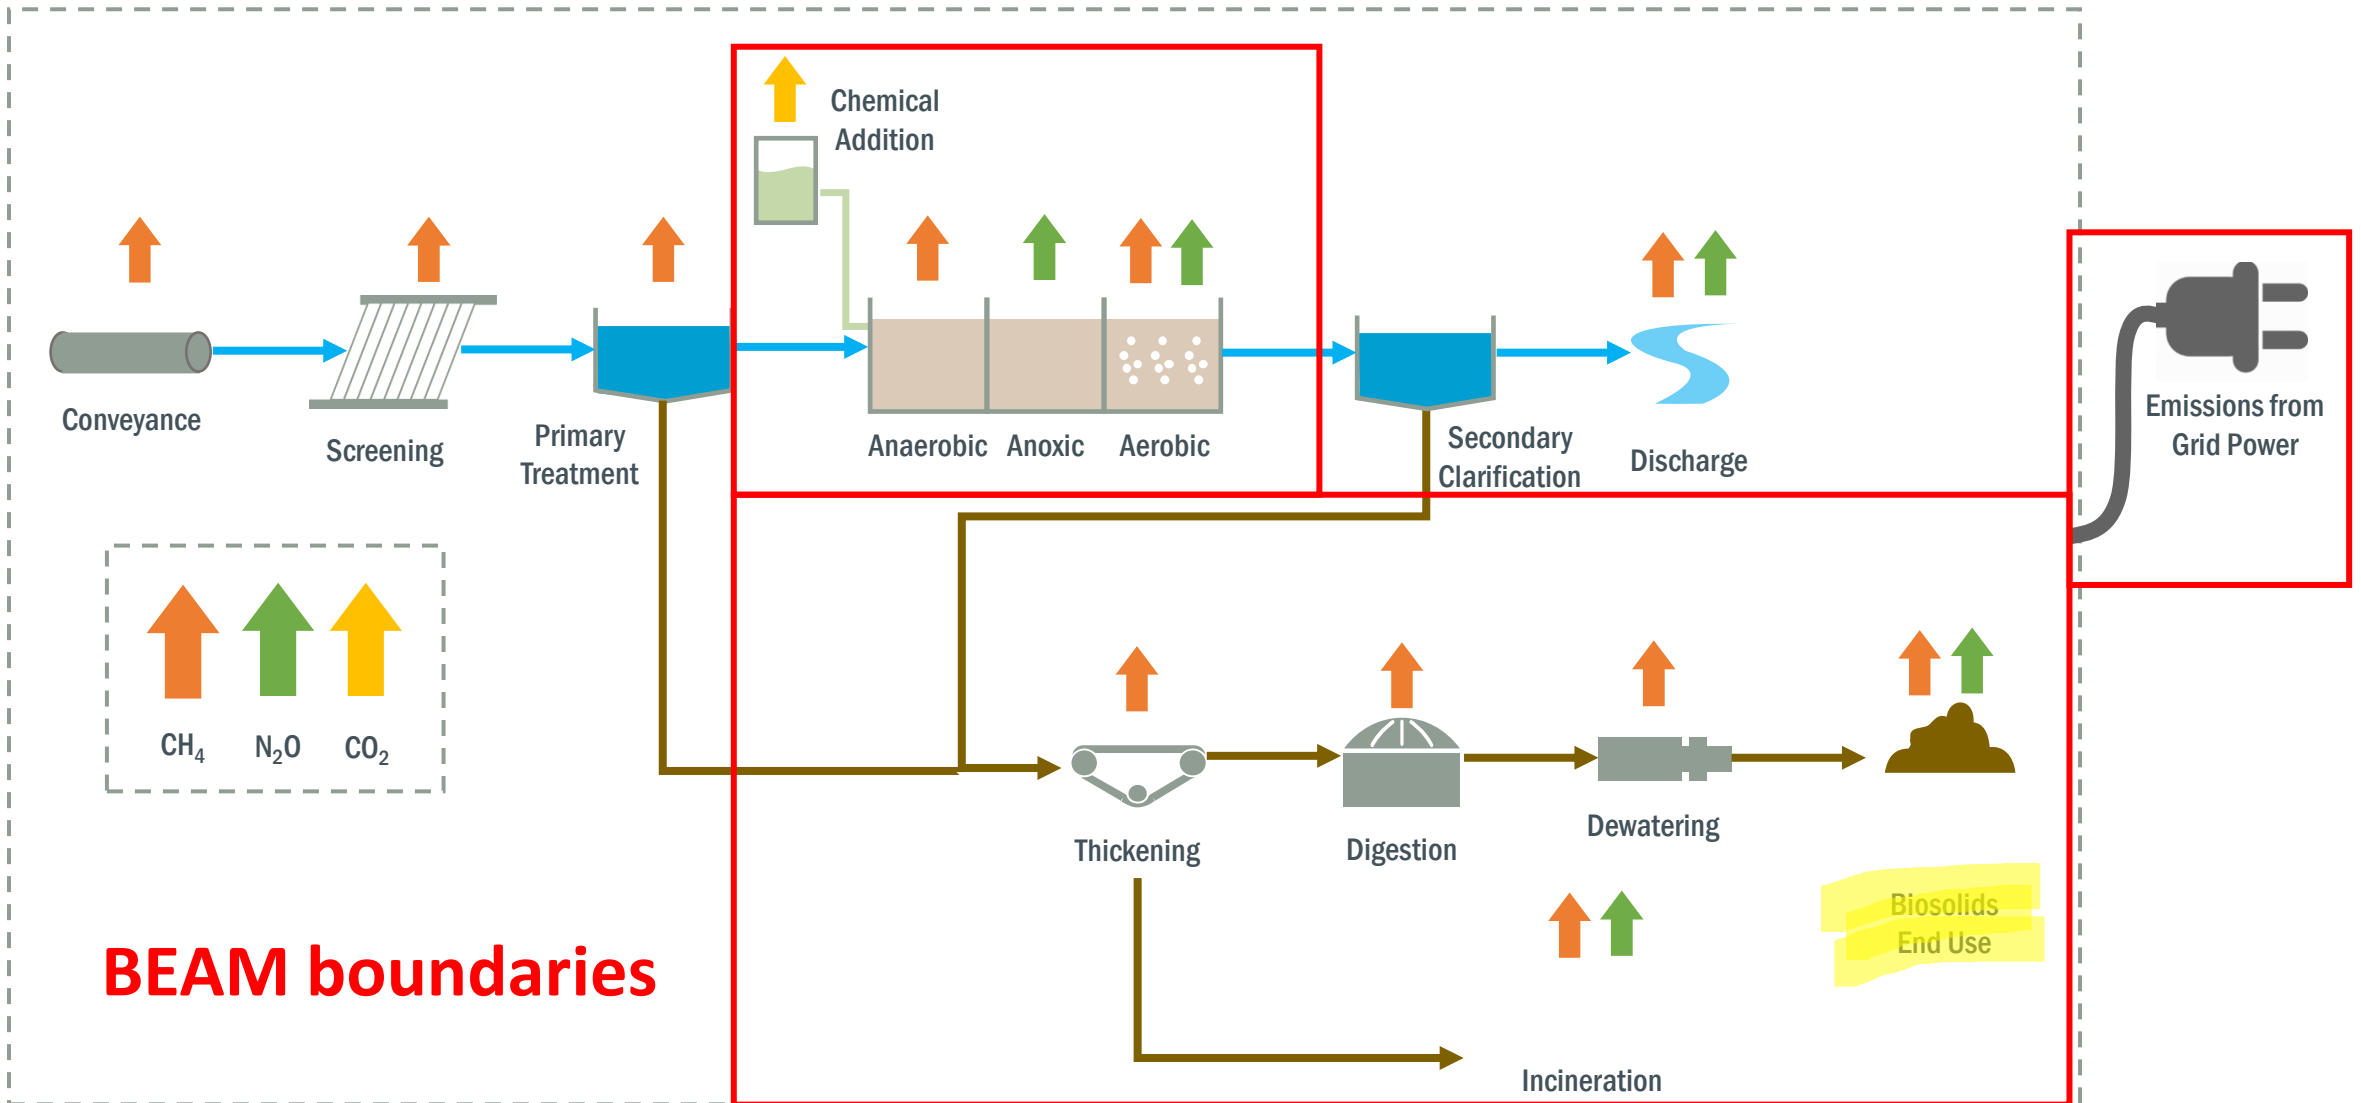

Purpose (from original CCME User Guide, 2009):

- estimate a program's GHG emissions, including establishing a baseline
- compare different biosolids management scenarios
- estimate impacts from changes in biosolids management
- understand the factors that have the greatest impact on GHG emissions

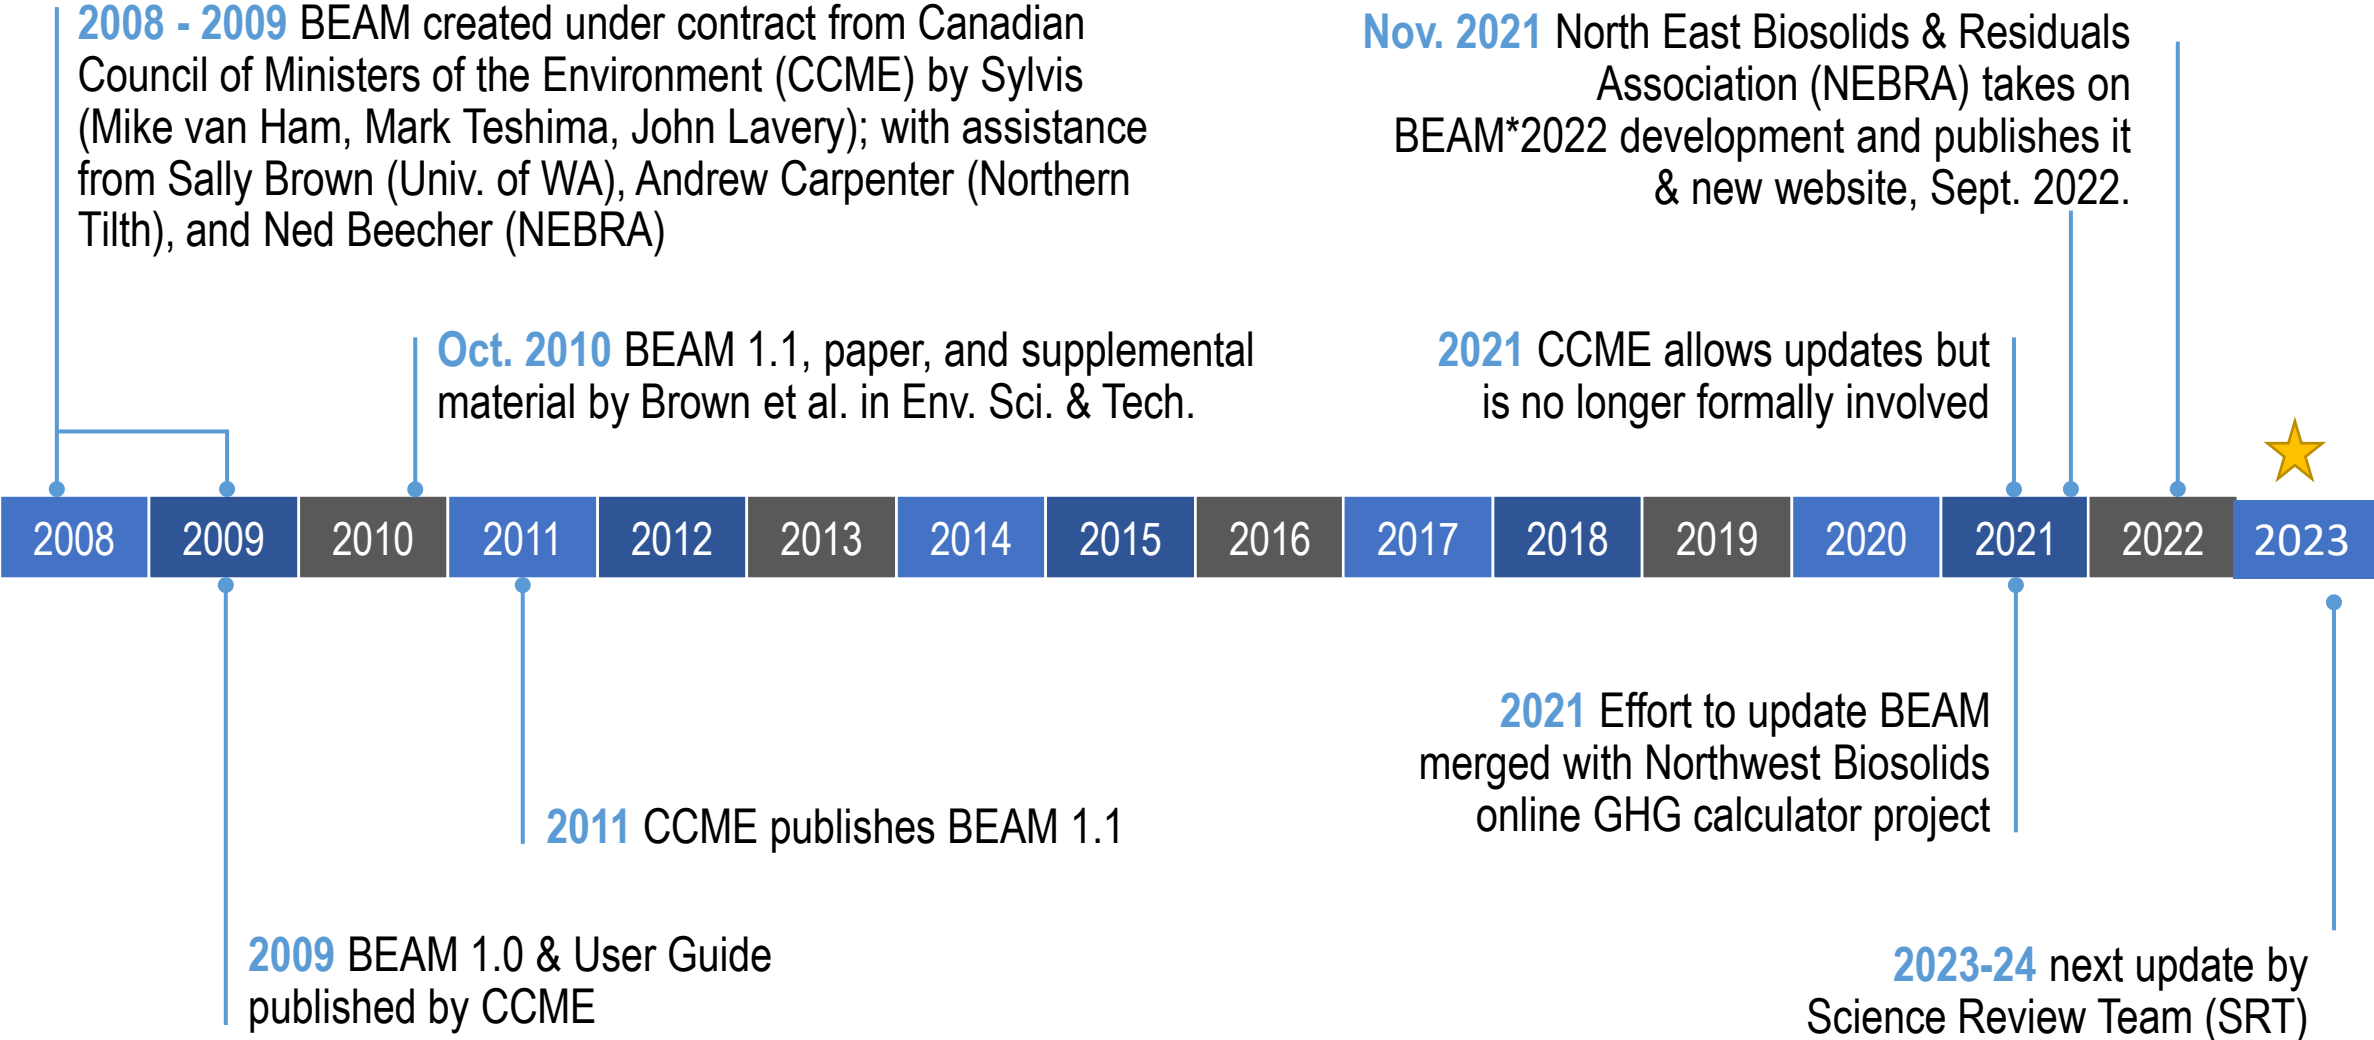

Unit Process	Enter "X" for all applicable processes:	Scope 1	Scope 2	Scope 3	Total	Wet tons to each unit process/day	Mg (wet) to each unit process/day	Dry metric tons to each unit process/day	Metric tons CO2e/dry metric ton biosolids
Storage		NA	NA	NA	NA	NA	NA	NA	NA
Conditioning/Thickening	X	0	#VALUE!	117	#VALUE!	NA	NA	NA	NA
Anaerobic Digestion	X								
Anaerobic Digestion 2	X								
Dewatering	X								
Thermal Drying									
BFT Biodrying									
Alkaline Stabilization									
Composting									
Composting 2									
Landfill Disposal Typical									
Landfill Disposal Worst-case									
Landfill Disposal Aggressive									
Landfill Disposal CA Regulatory									
Combustion									
Pyrolysis									
Land Application	X								
Land Application 2									
Transportation	X								
Scope 1 - direct emissions		405	NA	NA	405	76	69	17	0.05
Scope 2 - emissions associated with electricity		3,400	#VALUE!	(1,303)	#VALUE!				

Biosolids GHGs formulas to mitigate climate change

GHG Emission Sources from Wastewater Treatment Processes

BEAM – Background and History

BEAM*2022 and the new www.BiosolidsGHGs.org launched on September 20, 2022!

Updates Included:

Up to 10 scenarios can be compared side by side

More options for unit processes (e.g., pyrolysis)

Key factors and calculations reviewed and updated

Updated user guide

Default values and suggested ranges

Regular reviews & updates by the Science Review Team

Thanks to the Science Review Teams (SRT)!

References, Calculations, Assumptions and Default Values

Cell Color Key for References Worksheet	
Number used in original BEAM calculations (CCME, 2011)	Orange
Input Cell	Green
Calculated Result	Yellow
Constant	Light Green

Fuel & Transport

	diesel emissions	CO ₂ (kg/gal)	CH ₄ (g/mi)	N ₂ O (g/mi)	Total CO ₂ e (kg/gal)	
		10.21	0.0051	0.0048	10.21	https://www.geotab.com/truck-mpg-benchmark/
	rail emissions	CO ₂ (kg/ton-mile)	CH ₄ (g/ton-mile)	N ₂ O (g/ton-mile)	Total CO ₂ eq (kg/ton-mile)	
		0.023	0.0018	0.0006	0.023	from EPA emission factors for GHG Inventories - last mod. March 2018 - Table 9

CO₂ eq diesel (kg/gallon) 10.21 The Climate Registry's 2019 Default Emissions Factors

CO₂ eq diesel (g/L) 2,697 calculated from numbers above

Average truck miles/gal (diesel) 5.82 (for New York) From GeoTab data gathered from 31,170 trucks 2016-2017

Average truck km/l (diesel) 2.5 calculated from numbers above

Train hauling emissions (kg CO₂ eq/Mg-km) 0.016 calculated from numbers above

Natural Gas

CO₂ eq from combustion of natural gas(g/m³) 1,901 Canadian default CO₂ emissions factors for combustion of natural gas - Climate Registry General Reporting Protocol V. 1.1

Heat content (Btu/m³) 36,263 Canadian default CO₂ emissions factors for combustion of natural gas - Climate Registry General Reporting Protocol V. 1.1

Methane

density of methane gas (kg /m³) - at standard temp. and pressure 0.71 EPA 2006, Solid Waste Management and GHG Emissions

Heat content of methane (Btu/m³) 35,830 EPA 2004, Unit Conversions, Emissions Factors, and Other Reference Data

Propane

Mg CO₂ eq/cylinder 0.02 <https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references>

pounds propane/cylinder 18 <https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references>

CO₂ eq propane (Mg CO₂ eq/kg) 0.0029

Wastewater Treatment Factors

Typical TSS in sludge after primary sedimentation (kg/1000 m³) 150 Metcalf & Eddy, 2003, p. 1456

Expected solids concentration of combination primary/WAS unthickened sludge (%) 1.0% Metcalf & Eddy, 2003, p. 1492

Expected solids concentration in sludge from gravity thickener, primary and WAS (%) 4% Metcalf & Eddy, 2003, p. 1457

Typical Biosolids Characteristics (De-watered cake)

	unprocessed	digested	limed	
Total nitrogen (%-dry weight)	4.0%	5.0%	3.2%	Northern Tilt suggests values if data not available
Total phosphorus (%-dry weight)	1.5%	1.9%	1.2%	
TVS(%-dry weight)	78.0%	65.0%	52.1%	

All process assumptions and emission factors are listed in the Reference Assumptions tab.

THE NEW BEAM*2022 Screenshots

Instructions

BEAM
This version of the BEAM was updated to include 10 Scenarios in 2020. It was updated to include processes in 2021. The instructions below provide guidance for getting started and using the model.

Getting Started

The first sheets to fill out in the BEAM are the 'Scenarios Data' sheet and the 'Amount and Destination' organized into 10 Scenarios.

- 'Scenarios Data'**
On the 'Scenarios Data' sheet, the user fills in the olive green cells to names and describes each S should be included in the model. Each process corresponds to a sheet in the model, and each unit with each Scenario.

Tip Before beginning to fill out the model, have organized notes for each Scenario. Fill out which before filling out each unit process sheet, so that nothing contributing to GHG emissions is missed.
- 'Amount and Destination'**
Information about specific Scenarios goes into the 'Amount and Destination' sheet, including the categories, amount to each destination, and transportation information.

Two other important sheets are the 'Analyses' and 'WWRF Info & Results.' 'Analyses'

Though default values are provided in the model, it is best to use actual data where possible. Fill

Instructions | WRRF Info & Results | Scenarios Data | Amount and Destination

The model is color-coded so that the user knows where to enter data. A color-coded key is located on all user-input sheets.

Key		
Input	0	0
Default from reference values	0	0
Data used to calculate default (for information only)	0	0
Process output	0	0
Input with possible cell reference	0	0
Calculated result	0	0

Green input cells are for entry of known data. Data should be entered in the correct unit. Common unit conversion factors are included on the References & Assumption sheet.

If data is unknown, the default in the adjacent blue cell can be entered into the green cell instead.

Pink cells show values that are calculated based on inputs, which feed into blue cells. They contain information which may be useful or interesting to the user.

Gray cells hold GHG emission results from different steps of the process, as well as summed totals.

Orange cells are input cells as well, but they may be filled in with a formula that draws from another cell (i.e. the quantity of sludge going to composting may draw directly from the Amounts and Destinations sheet). Orange cells containing formulas may be overwritten if better data is available.

THE NEW BEAM*2022

Instructions

Appendix A Sheet-by-Sheet Instructions for E

Best practice is to save a copy of the original, unaltered spreadsheet for all future projects. When beginning a new project, open with a project-specific name. It may also be prudent to save changes are made to a project's BEAM*2022 spreadsheet. All cells other than input cells are password protected to prevent accidentally changing formulas.

The following instructions are organized by worksheet, **listed in the order in which data should be added.**

Step 1: Instructions

Review the instructions prior to beginning work on the model.

Step 2: WRRF Info & Results

Fill in the olive green input cells with the project's basic information. Once all other worksheets are filled out, this worksheet displays emissions for each of 10 possible Scenarios in the gray output cells. The "Processor" refers to the entity managing the material that is being modeled. Emissions generated by each unit process are displayed in CO₂ equivalents per dry metric ton of material. Total emissions per scenario are also shown, broken down into CO₂, CH₄, N₂O, and biogenic CO₂.

Input data for WRRF Info & Results sheet:

Site-Specific Data	Data Entry Notes
Annual Production of de-watered biosolids (wet tons)	Entered for information purposes only; not used in model calculations
Location (from e-Grid)	Choose from drop-down list of e-Grid regions
GWP time horizon (years)	Choose from drop-down list: 20-year or 100-year time horizon for Global Warming Potentials. BEAM*2022 default CO ₂ -eq for CH ₄ & N ₂ O follow the IPCC's 4 th Assessment Report. Users have option to overwrite the CO ₂ -eq values in the References & Assumptions worksheet if needed; see notes under Section 7: References & Assumptions of this User Guide.

Instructions

Step 2: WRRF Info and Results

Step 3: Scenarios Data

Step 4: Amount and Destination

Step 5: Analyses

Step 6: Digestion Process

Step 7: Unit Processes

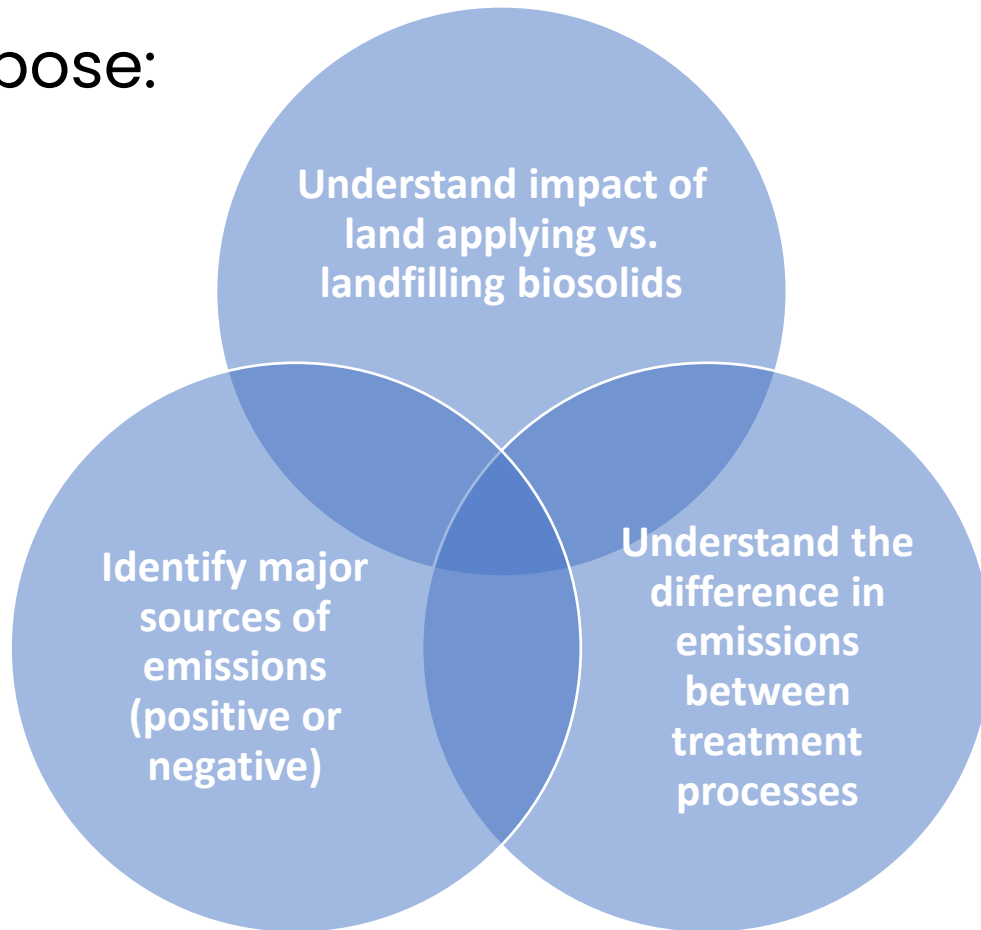

Step 8: Transportation

Step 9: Inspect Results

THE NEW BEAM*2022

Example of Use

Purpose:

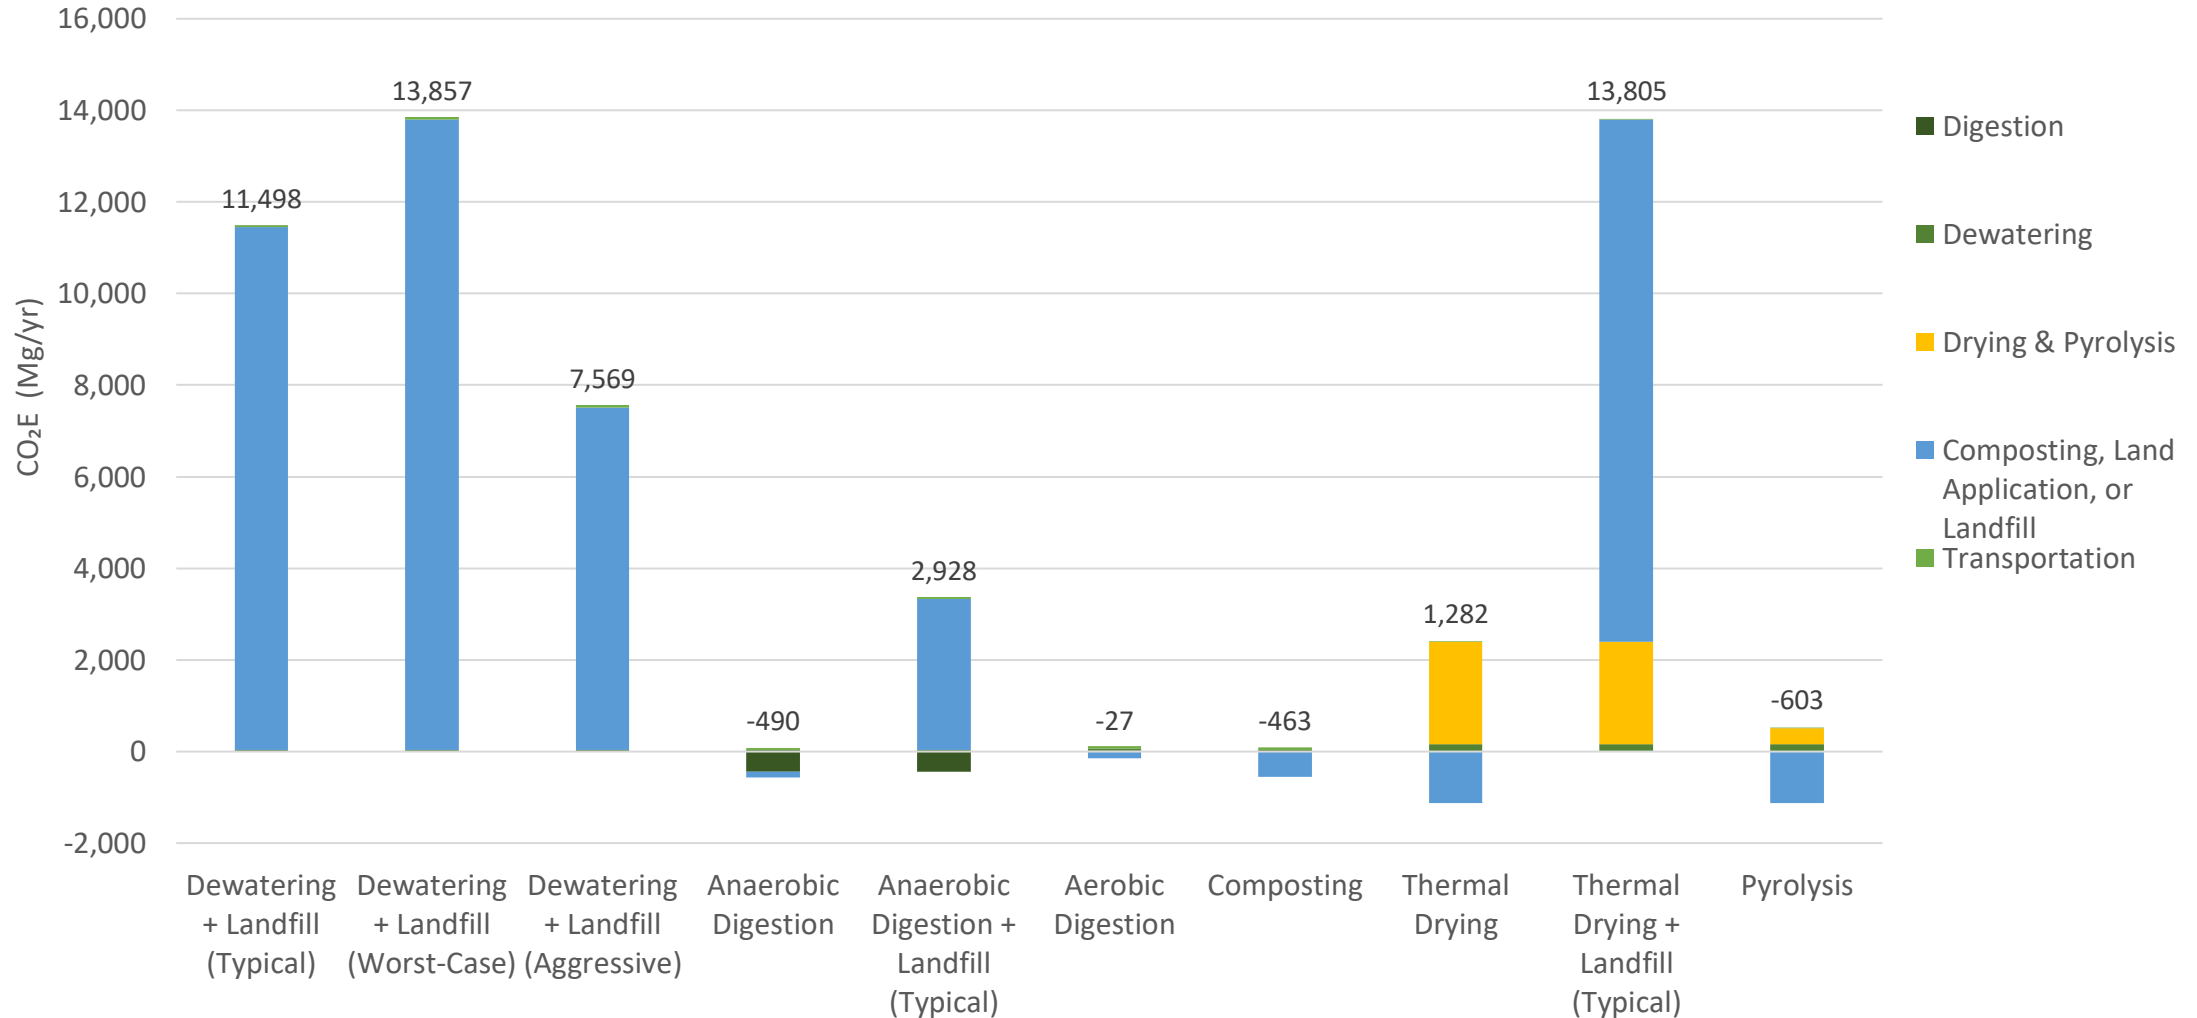

Estimating GHG Emissions for a 10-mgd WWTP

Treatment and End-Use Alternatives:

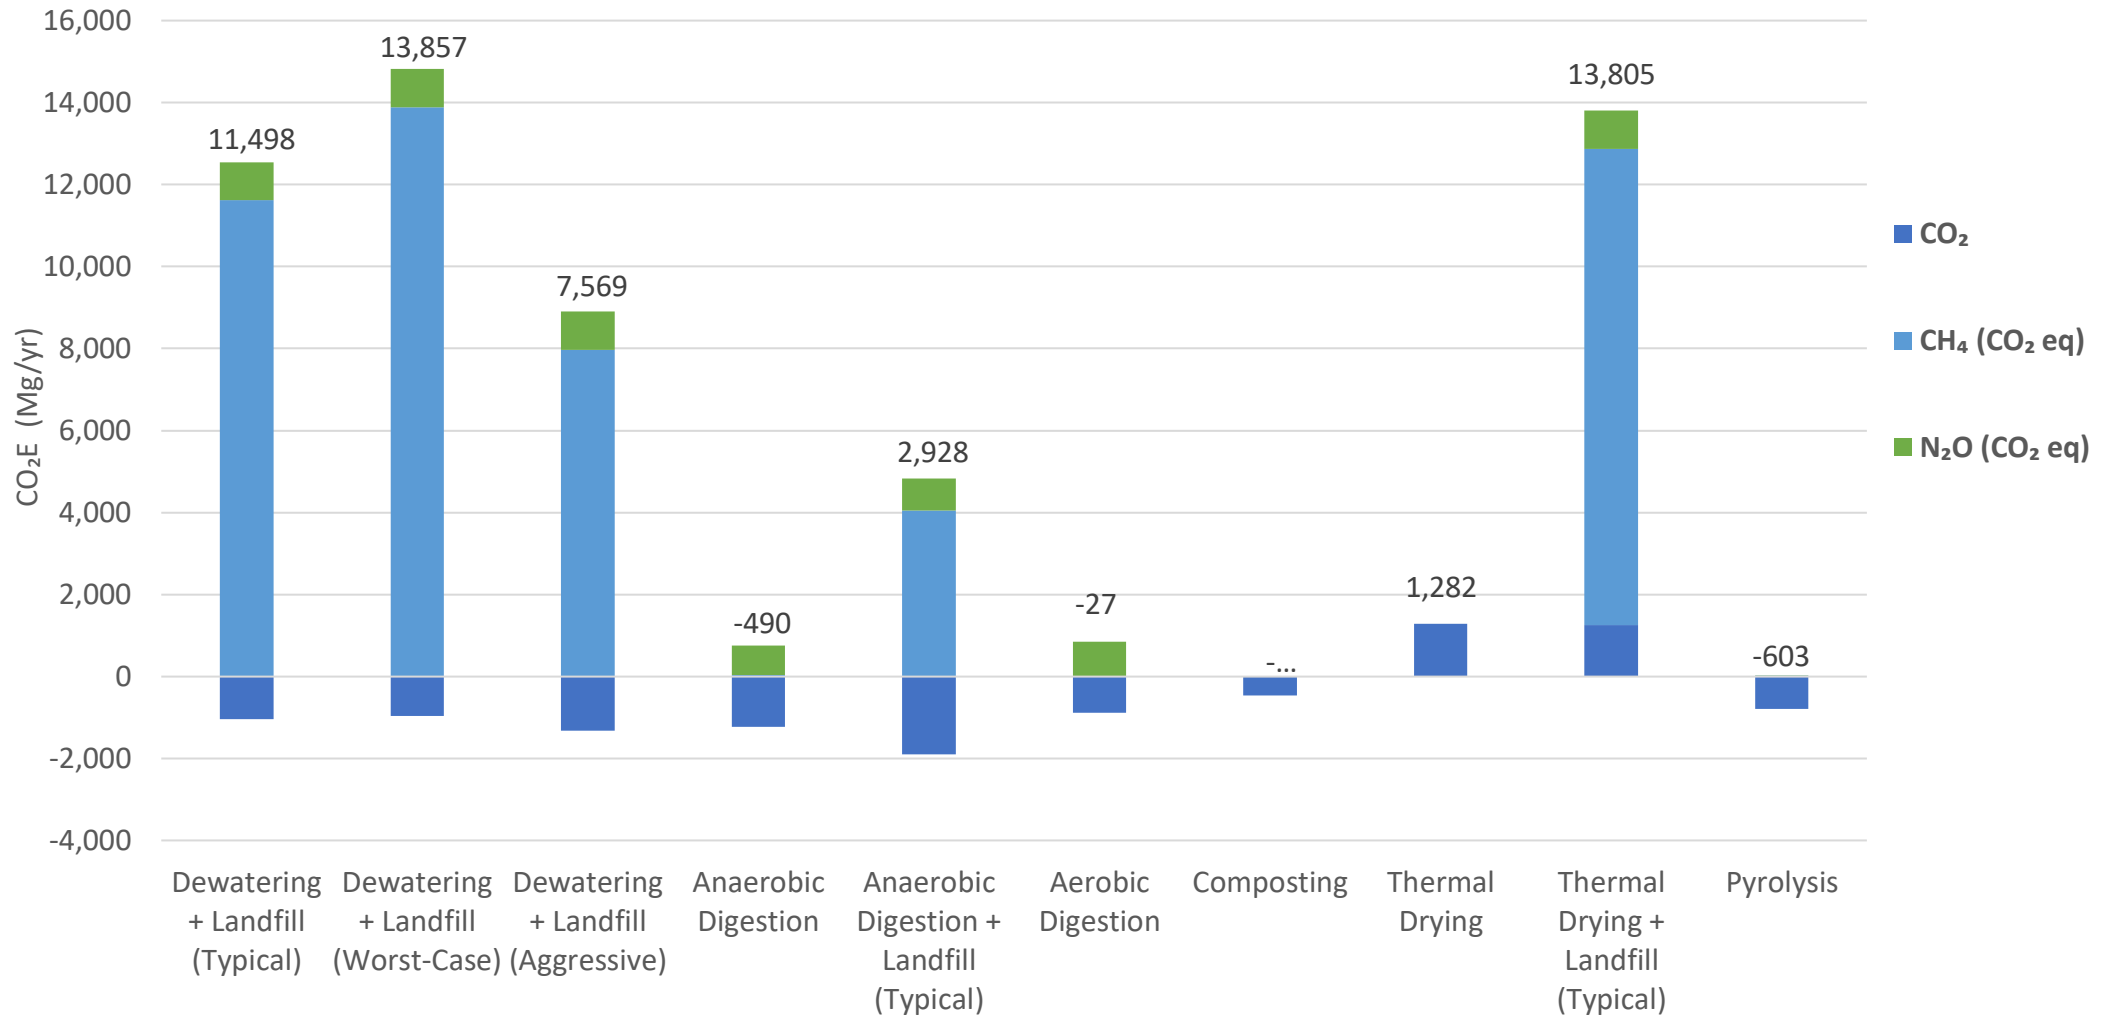

1. Dewatering + Landfill (Typical)
2. Dewatering + Landfill (Worst-case)
3. Dewatering + Landfill (Aggressive)
4. Anaerobic Digestion + Land Application
5. Anaerobic Digestion + Landfill (Typical)
6. Aerobic Digestion + Land Application
7. Composting + Land Application
8. Thermal Drying + Land Application
9. Thermal Drying + Landfill (Typical)
10. BioDrying + Pyrolysis + Land Application

Québec: Baseline & Comparing Alternatives

Table 1. Summary of emissions for the current scenario

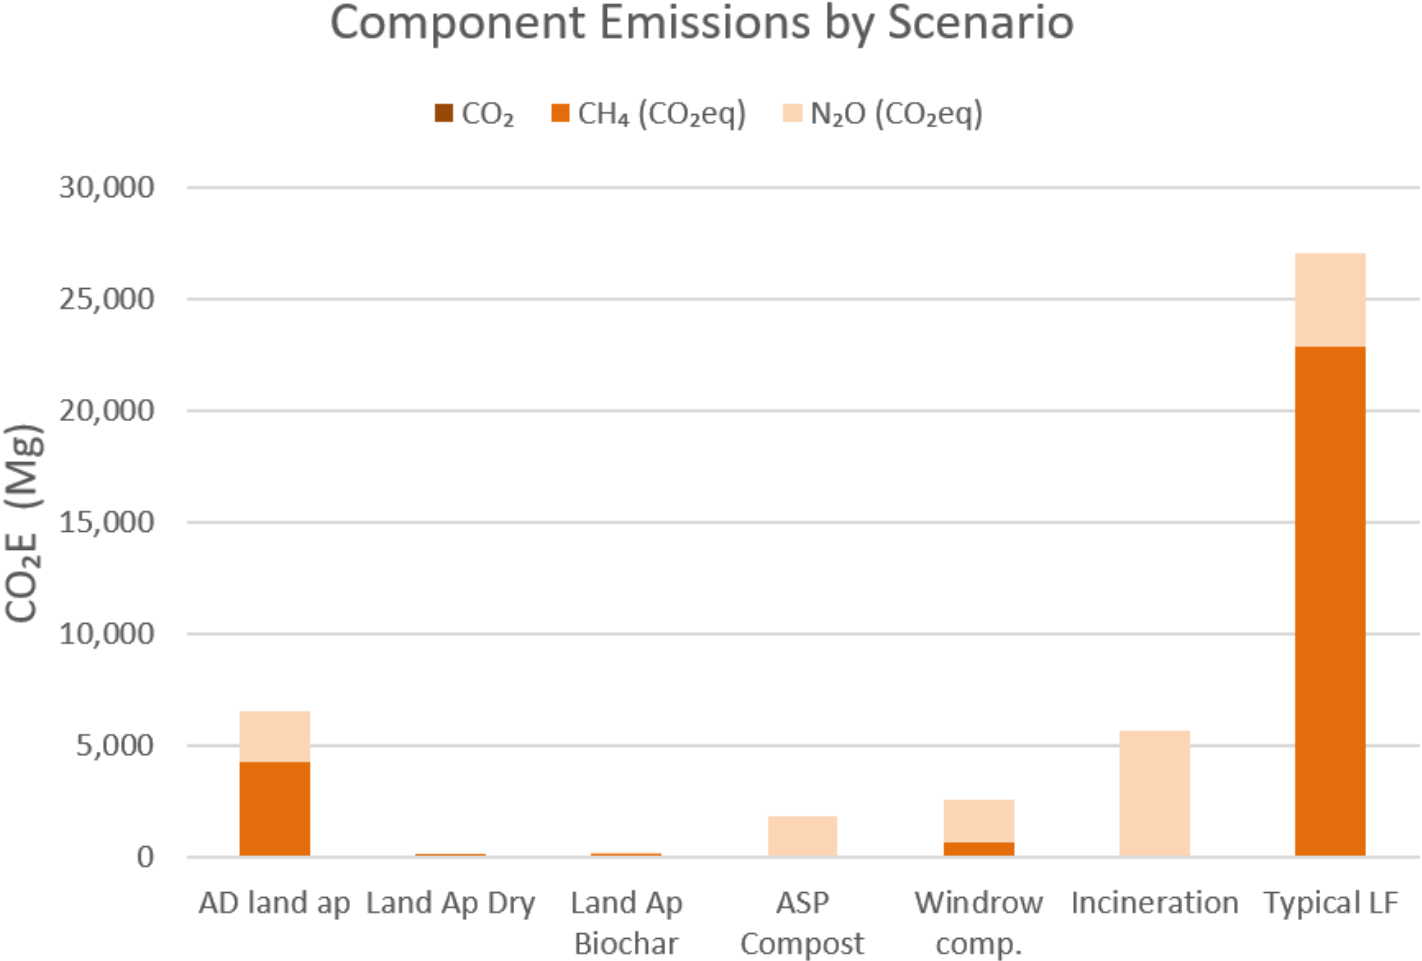

Agricultural valorisation (65%)	tCO ₂ e	Composting (35%)	tCO ₂ e
1-Process direct emissions			
Transportation	80	Transportation	41
Machinery	31	Machinery	88
CH ₄ emissions	67	CH ₄ emissions	221
N ₂ O emissions	47	N ₂ O emissions	360
Sequestration	-599	Sequestration	-287
2- Indirect emissions linked to energy use			
Electricity consumption	0	Electricity consumption	5
3- Other indirect emissions			
N replacement	-393	N replacement	-193
P replacement	-81	P replacement	-42
Total (1 + 2)	54		
Total (1 + 2 + 3)	-655		

Figure 2. Comparison of annual emissions for five different scenarios of biosolids management for the city of Saguenay.

BEAM*2022 Screenshot: Generic findings

actual results are dependent on local details & what options are possible

Featuring BEAM[®]2022

... a project of NEERA and NW Biosolids
... not the work or responsibility of CCME

... with support from:

About

This website provides information, data, and a calculator - BEAM[®]2022 - to help biosolids management programs reduce their greenhouse gas (GHG) emissions (carbon footprint)... The original Biosolids Emissions Assessment Model (BEAM) was published by the Canadian Council of Ministers of the Environment (CCME) in 2009/2010. Building on that, with CCME permission, and with input from multiple experts & stakeholders, NEERA & NW Biosolids present BEAM[®]2022 and supporting information...

[Learn more](#)

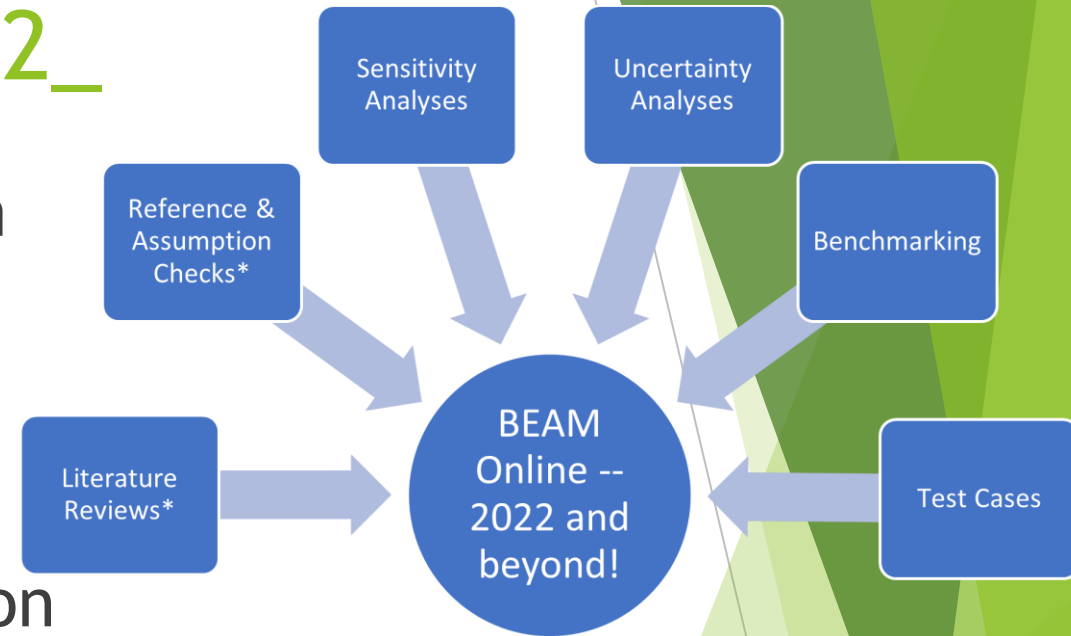

Sharing Data & Experiences

Share your GHG emissions data, calculations, experiences, & tracking. By compiling and sharing, the biosolids profession will improve understanding and consensus regarding baseline and best practices, creating comparable data and outcomes. This may lead to the ultimate goal of creating formal methods for carbon trading.

[Share now](#)

High Priority Topics for current SRT Review BEAM*202_

- ▶ Fertilizer offsets (GHG emissions from commercial fertilizer production)
- ▶ N₂O from combustion
- ▶ N₂O and methane from land application
- ▶ Fugitive CH₄ emissions from Anaerobic Digestion
- ▶ Carbon sequestration values

Future?

- ▶ BEAM*202_ further builds consensus as *THE* method for calculating GHG emissions from biosolids management
 - ▶ A resource hub with crowd-sourced supporting information & examples
 - ▶ Respected source for biosolids-specific emissions/reductions/sequestration factors (as found in references)
 - ▶ Eventually helping develop protocols and working with registrars to allow for marketable carbon offsets
 - ▶ **Your input welcome & needed.**
